Problem 4

[10p] Given a parameter i,

1. Provide the pseudocode of an algorithm that generates the ith Fibonacci tree.

```
FibonacciTree(int i)
    if(i == 0) return null
    else if(i == 1)
        rootNode = new node()
        rootNode.left = null
        rootNode.right = null
        return rootNode
    else
        rootNode = new node()
        rootNode.left = FibonacciTree(i - 1)
        rootNode.right = FibonacciTree(i - 2)
        return rootNode
```
