

Exercise 4 : Hash Tables

Task 1: Open addressing with linear probing

[code in the wet part : `HashFuncComp`]

Here's the output we get :

HashFunction	SuccessProbes	UnscsProbes	LargestCluster
hash1	1.941	4.648	19.826
hash2	1.933	4.651	19.798
hash3	1.938	4.646	19.852
hashBest	1.904	4.460	19.374
hashMul	1.906	4.492	19.310
hashDiv	1.894	4.415	19.053

We find that the discrepancies between the function values are not statistically significant, which may be attributed to the low **load factor**(67%) that is unlikely to induce catastrophic clustering.

Task 2: Hashing with Overflow Area

[code in the wet part : `overflowHash`]
